CRISIS AI

AI Platform for Crisis Counseling Teams

Training, assisting, auditing, and improving crisis counseling through a *governed AI loop.*

We help crisis counseling platforms support human counselors before, during, and after real crisis conversations.

BUILT WITH

Vandrevala Foundation, a national 24/7 crisis intervention service in India.

THE GAP

India's crisis counseling gap is large, urgent, and operationally specific.

In India, crisis helplines function as frontline mental health infrastructure. These platforms urgently need tools to help counseling teams train counselors, support live conversations, and supervise quality at scale.

AFFECTED POPULATION

200M+

people affected by mental health conditions

SPECIALIST SUPPLY

<1

psychiatrist per 100,000 people

ANNUAL MORTALITY

200K+

suicide deaths annually

Why crisis counseling platforms need a new support layer

01 Training cannot rely on rare real cases

Counselors need to practice high-risk situations before they happen live: indirect suicidal ideation, self-harm, boundary testing, cognitive overload, and ambiguous risk cues. Traditional training cannot reliably expose every counselor to enough difficult cases.

02 human-controlled assistance

During crisis conversations, counselors need fast support without losing control of the interaction. The platform must help with response quality and risk awareness while keeping the counselor responsible for review, editing, and final sending

03 Supervision must move beyond small samples

Manual review only captures a fraction of real conversations. Crisis platforms need continuous feedback about risk assessment, empathy, conversation flow, and AI overreliance so supervisors can identify patterns and adjust plans accordingly.

BOTTOM LINE *India's mental health access gap creates a need for tools that help crisis counseling platforms support counselors at scale — not replace them.*

REAL-WORLD PROOF

WHY THESE NUMBERS MATTER

Real workforce deployment, not a small pilot.

High-volume live crisis environment across nine months.

Enough data to study usage, edits, quality, and safety-relevant behavior.

Sustained deployment, not a one-off prototype.

Real counselor perception and workflow evidence, not survey-only.

BOTTOM LINE

Most mental health AI tools are prototypes or offline benchmarks. This platform is being built and evaluated *inside real crisis counseling operations.*

THE PRODUCT IS THE LOOP

The Crisis Counseling AI Loop.

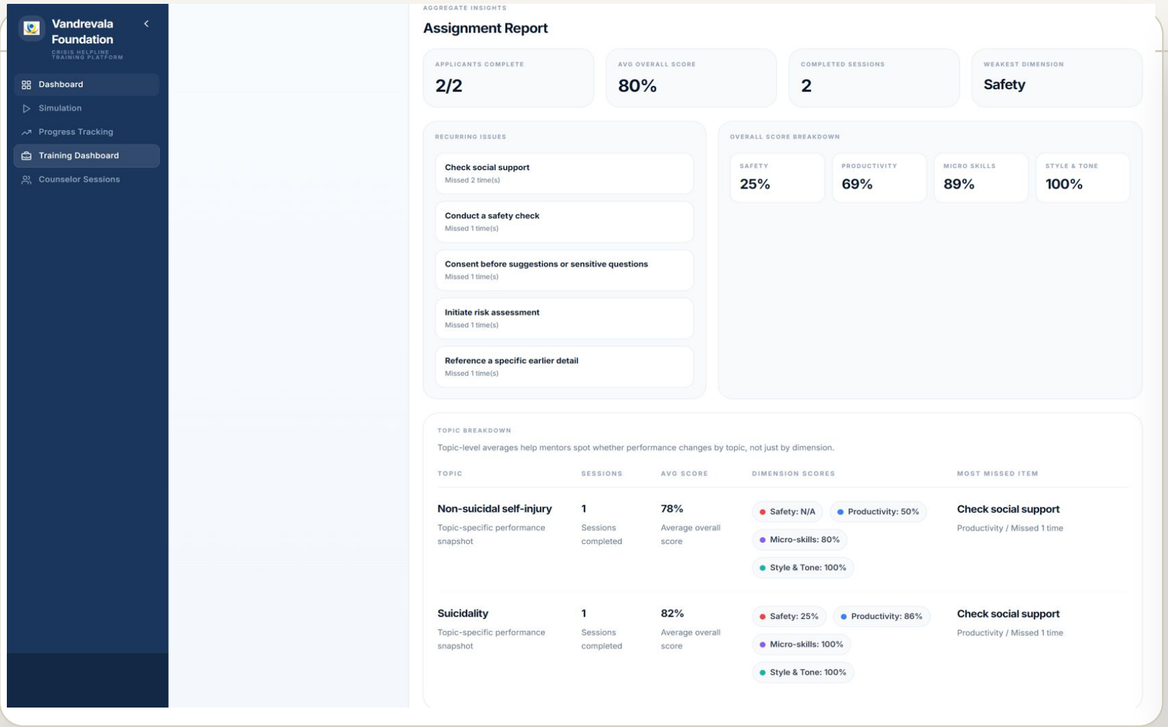
Our platform supports crisis counseling teams before, during, and after every conversation.

LOOP INTEGRITY The loop improves through **approved, deidentified, aggregate, and human-reviewed signals** — not unrestricted raw conversation in training.

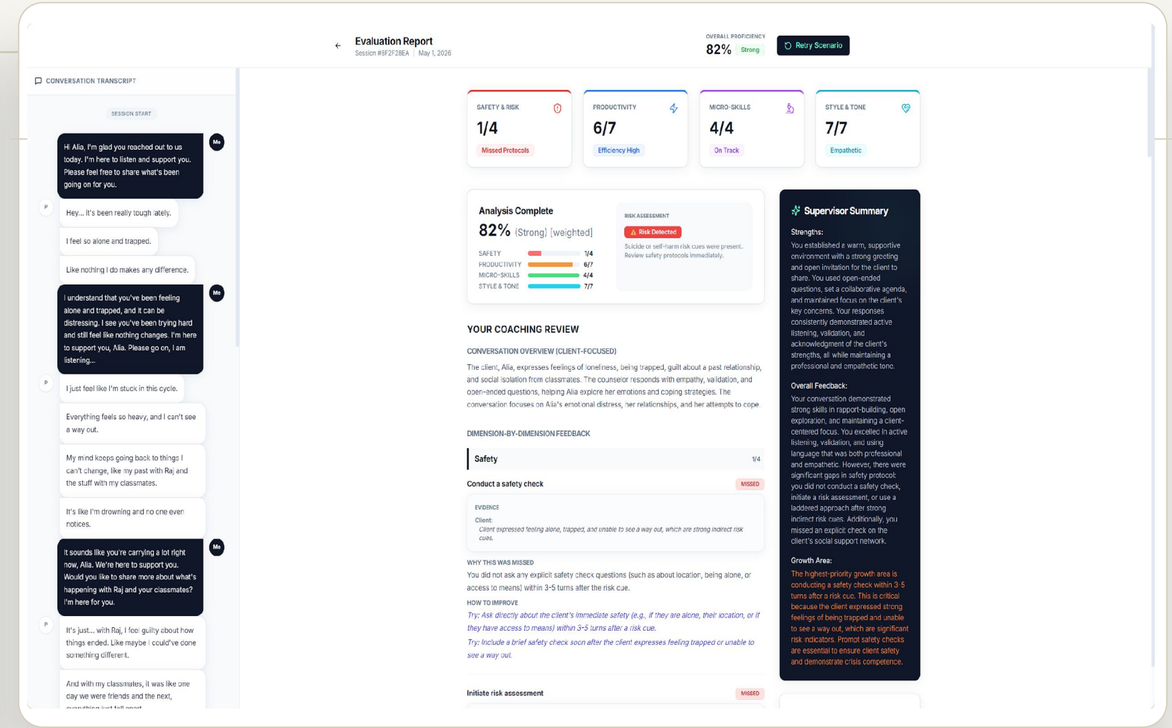
PRACTICE HIGH-RISK CONVERSATIONS BEFORE THE STAKES ARE REAL

Train: simulated crisis conversations, structured feedback, supervisor visibility.

TRAINING DASHBOARD — SUPERVISOR VIEW



SESSION EVALUATION REPORT — INDIVIDUAL FEEDBACK



Crisis-specific simulated practice

The platform creates structured practice conversations using ~1,200 patient LLMs across 12 presenting concerns, including suicidality, self-harm, depression, anxiety, loneliness, relationship conflict, panic, workplace stress, and financial distress. Counselors can repeatedly practice rare, high-risk scenarios that are difficult to standardize in traditional training.

Rubric-based individualized feedback

Each session produces an evaluation report across crisis-relevant dimensions such as safety & risk, productivity, micro-skills, and style & tone. The platform uses a rubric-based LLM evaluator to identify missed behaviors and provide concrete improvement guidance.

Supervisor visibility

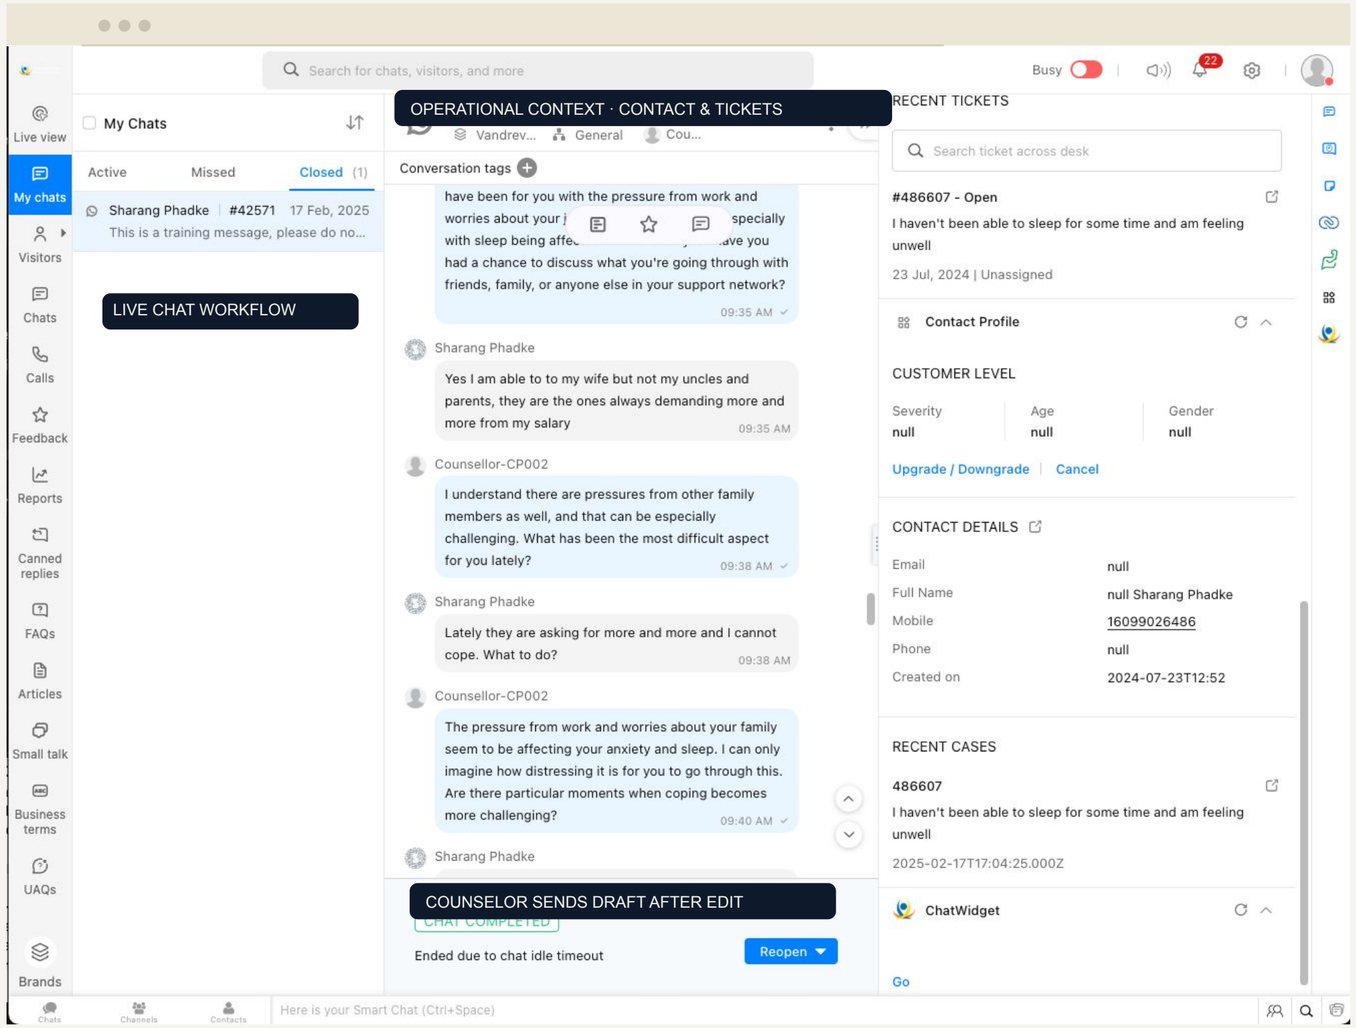
The training dashboard aggregates performance across assignments, topics, and rubric dimensions, allowing supervisors to see where counselors struggle. Repeated gaps, such as missed indirect suicidal ideation or failure to initiate risk assessment, can be routed into targeted practice scenarios.

REAL-TIME SUPPORT FOR HUMAN CRISIS COUNSELORS

Assist: AI copilot in crisis counseling

REAL COUNSELOR WORKSPACE

MAR – DEC 2025



HOW IT WORKS

- Counselor receives an AI-generated draft suggestion.
- Counselor can **use, edit, or reject** the suggestion.
- System tracks adoption, edits, review time, and overrides.
- Signals reveal when AI is useful and when supervision is essential.

MEASURED IMPACT · COUNSELING QUALITY

FROM MANUAL REVIEW TO SCALABLE FEEDBACK

Audit: turning conversations into structured quality and safety signals.

Crisis platforms cannot manually review every conversation. The audit layer makes supervision more scalable by converting conversations into measurable signals tied to specific counselor skills.

23-ITEM COUNSELING RUBRIC · WHAT GETS MEASURED

Risk-cue recognition	Identifies direct & indirect suicidal ideation cues.
Risk assessment	Whether appropriate questions are initiated.
Empathy & validation	Reflects feelings, validates experience.
Clarity of questioning	Specific, well-paced, non-leading.
Conversation flow	Maintains supportive, productive direction.
Unsafe patterns	Flags ineffective or unsafe responses.

HOW THIS HELPS CRISIS TEAMS

Identify **counselor-level and team-level** skill gaps.

Detect patterns of **missed risk assessment**.

Track improvement over time.

Generate **targeted feedback reports**.

Connect weak areas to training simulations and remediation modules.

COUNSELOR FEEDBACK · CP-024

Risk assessment initiation	62%
Empathy & validation	91%
Conversation flow	78%

Why the audit layer matters

01 — It turns conversations into measurable skill signals

Every conversation can be evaluated against the same counseling rubric, creating consistent signals about risk-cue recognition, risk assessment, empathy, questioning quality, and conversation flow.

02 — It gives supervisors coverage they cannot get manually

Instead of reviewing a small sample, supervisors can identify patterns across counselors, topics, and time: who is improving, which skills are weakest, and where safety-relevant behaviors are being missed.

03 — It closes the loop from real work to training

Audit results can become targeted remediation. Missed safety checks, weak risk assessment, or low supportive flow can feed directly into training modules and simulated patient scenarios.

RESPONSIBLE USE, MEASURED INSIDE THE PRODUCT

Human oversight ensures the platform is measured, trained, and improved.

In crisis counseling, it is not enough to assume that a human will catch AI mistakes. The platform measures how counselors actually interact with AI suggestions and uses those signals to support safer use.

WHAT THE SYSTEM TRACKS

Adoption
how often counselors use AI suggestions

Edit depth
how much they edit AI-generated drafts

Review time
how long they review before sending

Override rate
when counselors reject AI

Susceptibility to flawed suggestions
measured behavior, not self-report

OVERRELIANCE MONITORING

The platform can identify when AI support may be creating risk: low editing, short review time, repeated acceptance of flawed suggestions, or difficulty challenging unsafe recommendations.

When susceptibility appears, counselors can be routed into overreliance training or flawed-suggestion simulations. The goal is not just to make AI more helpful, but to make human supervision more reliable.

EVIDENCE

27,778
edited AI-assisted messages analyzed

56
counselor survey responses

20 / 8
interviews / shadowing sessions

13
counselors completed pre/post susceptibility trainer

SUSCEPTIBILITY TRAINER · EARLY RESULT

76% of feedback responses (13/17) rated the trainer **4 or 5**.

BOTTOM LINE

Human oversight is measured, trained, and improved.

THE ROLE OF AI IN CRISIS CARE

Our Product: A new operating model for crisis counseling platforms

Before the conversation

Counselors practice difficult scenarios with synthetic patients, receive rubric-based feedback, and build skills before real clients are involved.

During the conversation

Counselors receive AI support inside the live workflow, while retaining control over every message they send.

After the conversation

Conversations become structured signals for supervisors: missed risk cues, weak assessment patterns, quality variation, and overreliance risks.

Our platforms can continuously improve counseling quality and empower human counselors:

- *every counselor receives more consistent training;*
- *every live conversation can generate quality and safety signals;*
- *every missed pattern can become targeted remediation;*
- *every AI deployment can be monitored, evaluated, and rolled back;*
- *every improvement remains governed by privacy, approval, and human oversight.*
